

## Python Win installation common errors and solutions

- *COM busy* Error message. It appears like this (Win 2000 O.S.):

*Solution:*

this could be because of other applications using the same COM port used by PythonWin during some operations (e.g. during a Downloading procedure) : close or disconnect the control of the COM port of the other applications (e.g. hyperterminal, etc.), close Pythonwin application , restart it again and try the operation again

- *Module seems not connected* Error message. It appears like this (Win 2000 O.S.):

*Solution:*

this could be because, during some operations with PythonWin (e.g. during a file Downloading procedure-), the COM port set in the *MDM emulation COM port* field by **Telit COM Port Selection tool** is not the AT command COM port available : check the COM port available to send AT commands and then set this COM port in the *MDM emulation COM port* field by **Telit COM Port Selection tool** . Close the Pythonwin application , restart it again and try the operation again with the new COM port setting
